

WHAT'S NEW

Hyperion Perimeter Security

Wren Solutions is pleased to announce the release of Hyperion version 2.6 for perimeter security on February 15, 2023. This release includes features to increase the ease of setup and configuration with automated camera analytic initialization as well as added security enhancements.

Wren cameras are now **provisioned by Hyperion** and setup for use in Automations. This saves time in installation and removes the need to connect to each camera individually and setup detection analytics.

Support for a **5 MP Wren camera** that is used for **detection** to activate automated response is included with this release. The camera has several analytics that can be used to increase the accuracy of onsite behavior identification, reducing false activations and strengthening the impression of control. Additionally, the increased resolution will be useful with future Hyperion capabilities such as video verification.

Multiple security enhancements were added including **two-factor authentication (2FA)**. 2FA can be turned on by user in Hyperion to add an extra layer of security. User account lockout functionality was enabled to prevent brute force attacks. Additional technology updates were made to provide the strongest levels of system security.

Upgrade Eligibility

Users of the Hyperion cloud-based application will need to upgrade the Hyperion gateways to utilize all new features included in this release.

To determine eligibility and request your upgrade for users not yet utilizing Hyperion cloud-based application version 2.4 or greater, contact your sales representative or send requests to: support@wrensolutions.com.
